The Mystery of Dark Matter

Katherine Freese

 Director, Weinberg Institute for Theoretical Physics, Jeff & Gail Kodosky Chair,
 Prof of Physics, University of Texas, Austin Guest Professor, Stockholm University

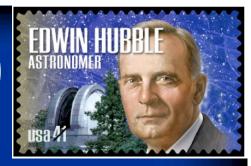

Director Emerita, Nordita (Nordic Institute for Theoretical Physics, in Stockholm)

Origins of Modern Cosmology

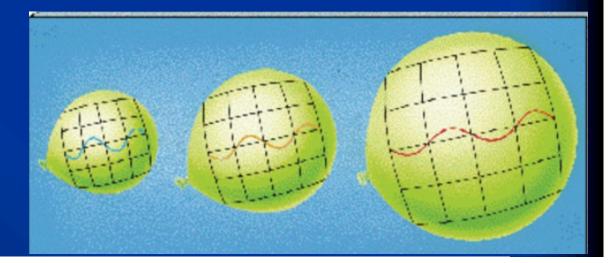

- A scientific approach to the shape and evolution of the Universe date to the brilliant insights of Einstein's General Relativity in 1915.
- Friedmann, Robertson, Walker, Lemaitre (1920's) applied Einstein's theory to the universe as a whole.
- Several possible solutions to the equations existed: expanding, contracting, or static.
- Einstein preferred the extra symmetry of a static Universe. Idea of small universe is consistent with static universe. He postulated that it looks the same (on the average) at all times.

Hubble Expansion in 1929

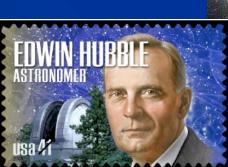

- Edwin Hubble using the Mt. Wilson Observatory above Pasadena made astronishing discoveries.
- He proved that other galaxies exist beyond our own.
- He observed light from galaxies at various distances away from Earth. The light waves are stretched, or redshifted, by the time they gets to us. The reason is the expansion of space.
- THE UNIVERSEIS EXPANDING

Einstein
 abandoned
 the static Universe

Galaxies are moving apart from one another. The Universe is expanding.

(1929)

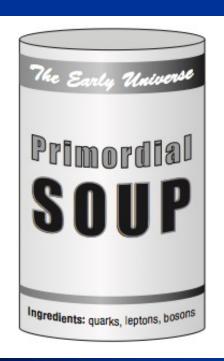

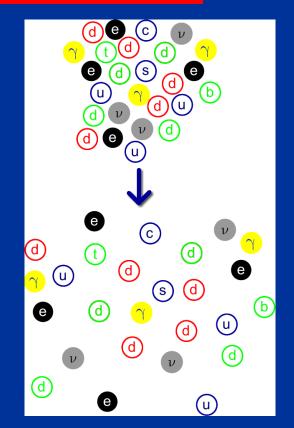

THE BIG BANG

14 BILLION YEARS AGO

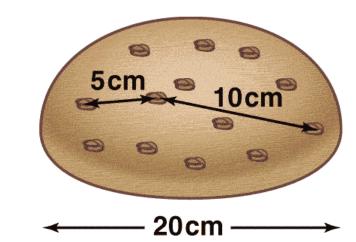

The Universe started out hot; It is cooling and expanding.

Raisin Bread Model of the Universe

 As the loaf rises, raisins move steadily apart from one another, with the loaf maintaining the same configuration.

MAP990404

As we look backwards in time:

All points in infinite universe getting closer and closer
 --- yet universe can still be infinite all the way back!
 Eventually, the density at each point is so great we lose description (maybe string theory?)

Big Bang at every point in the universe.

Big Bang happens everywhere at once (not at a single point)

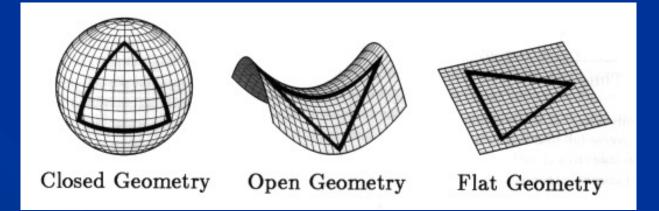

Where do we stand in Cosmology?

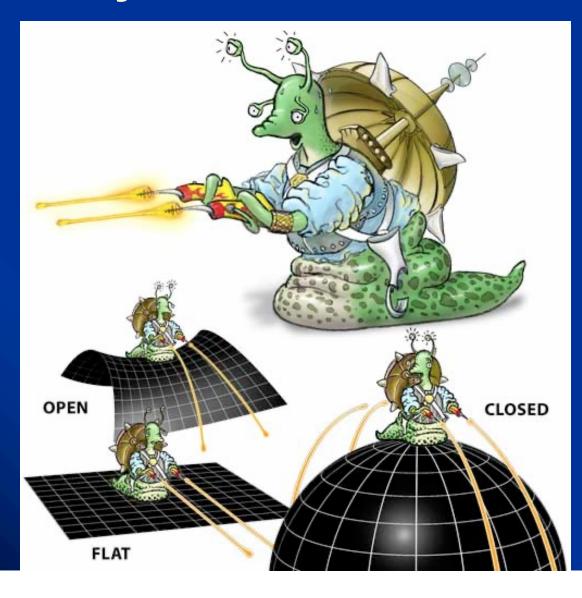

- Big questions answered at the turn of the millenium:
- What is the geometry of the Universe?
- What is the total mass/energy content of the Universe?
- How old is the Universe?
- Primordial density perturbations lead to growth of structure
- BUT other big questions remain:
- How did the Universe begin?
- What is the Universe made of? Dark matter, dark energy.

Geometry of the Universe

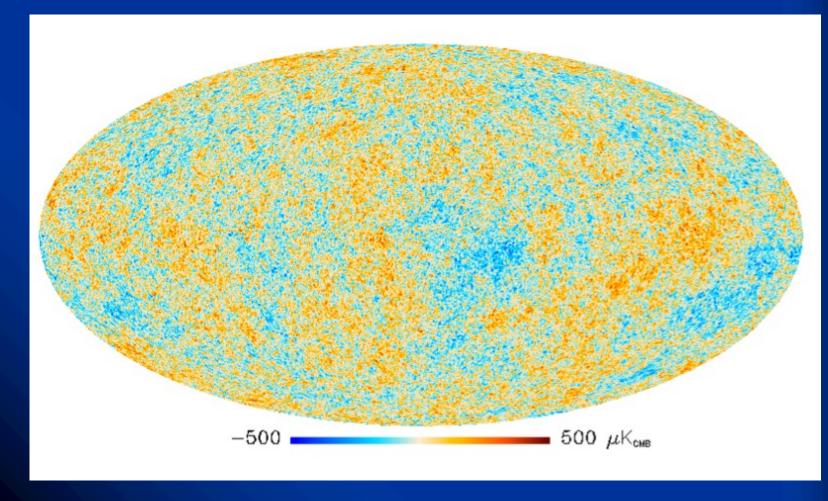

1930: Three possible geometries for the universe2000: The geometry of the universe is FLAT!!!!!!

Geometry of the Universe

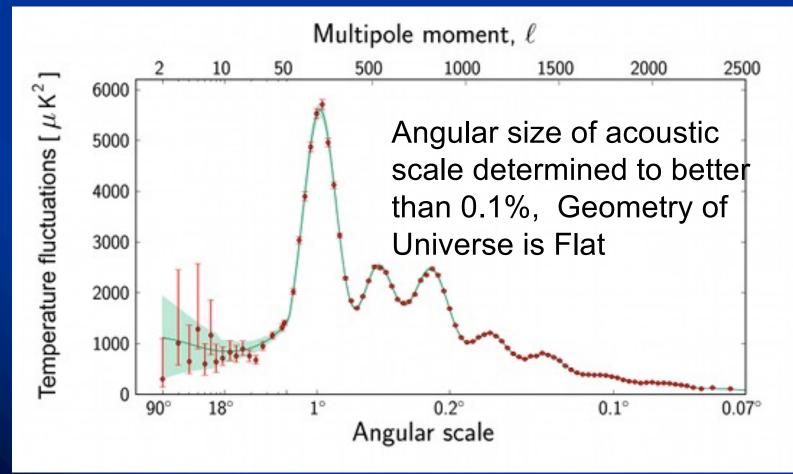

The Universe according to ESA's Planck Space Telescope: the Cosmic Microwave Background (light leftover from the hot early epoch of the universe)

Planck Data

If light moves in straight lines, then we expect a peak at 1 degree

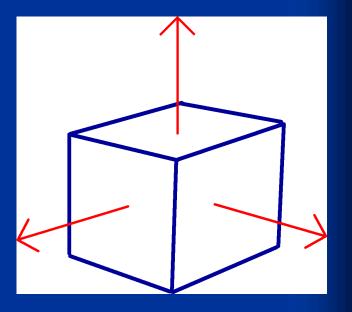

2000: The geometry of the universe is FLAT!

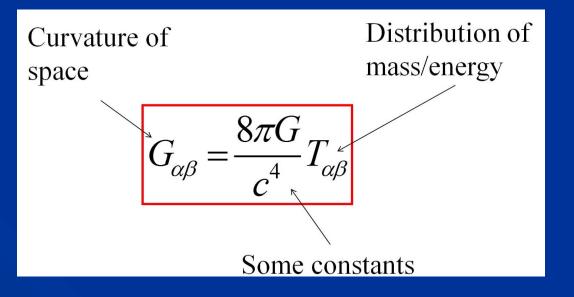

Universe has Flat Geometry

- Universe is NOT two-dimensional.
- Goes out to infinity in all three directions:

Shortest distance between two points is a straight line. No curvature required, no weird geometry.

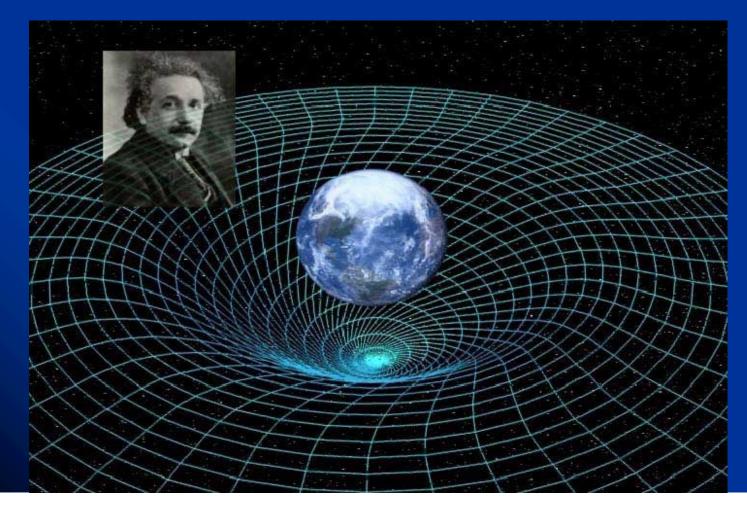

General Relativity: Einstein's Field Equations (1915)

Relates geometry (left hand side of equation) to matter/energy content (right hand side of equation)

Geometry is Determined by Matter Content

Warping of Spacetime:

Einstein's relativity connects the geometry with the total mass/energy content

The energy density of the universe is

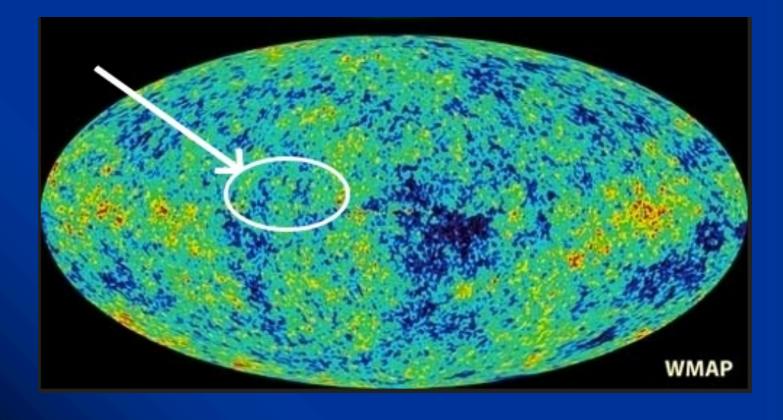

$$\rho = \rho_c = 10^{-29} \text{ gm/cm}^3$$

(compare to water on Earth, which has 1 gm/cm³)

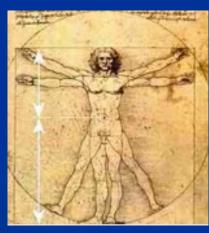

This is the density of "outer space" (as I tried to explain to the Queen of Sweden)

BIG QUESTION: WHAT IS IT?

SH initials in WMAP satellite data

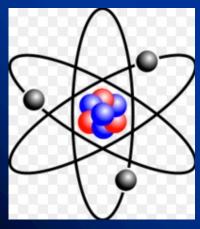

What is the Universe made of? The answer is very SURPRISING! All the objects of our daily experience:

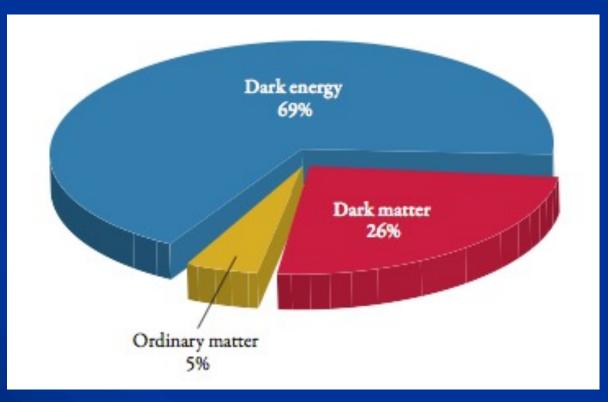

ALL ADD UP TO ONLY 5% OF THE UNIVERSE!

PIE PICTURE OF THE UNIVERSE

Less than 5% ordinary matter. What is the dark matter? What is the dark energy?

The Cosmic Cocktail Recipe

3 oz. dark matter
7 oz. dark energy
1/2 oz. hydrogen and helium gas
3 thousandths oz. other chemical elements
5 hundredths oz. stars
5 hundredths oz. neutrinos
5 ten-thousandths oz. cosmic microwave background light
1 millionth oz. supermassive black holes

Shaken, not stirred. Secret ingredient: dark matter

The Dark Matter Problem is 90 years old: Dates back to Knut Lundmark in 1930 and Fritz Zwicky in 1933

Knut Lundmark

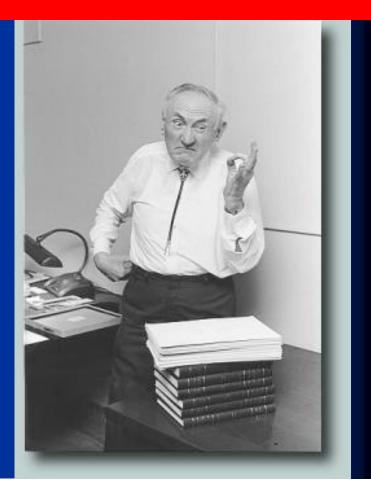

Knut Lundmark as student in 1908

Galaxies in the Coma cluster were moving too rapidly.

Proposed Dunkle Materie as the explanation.

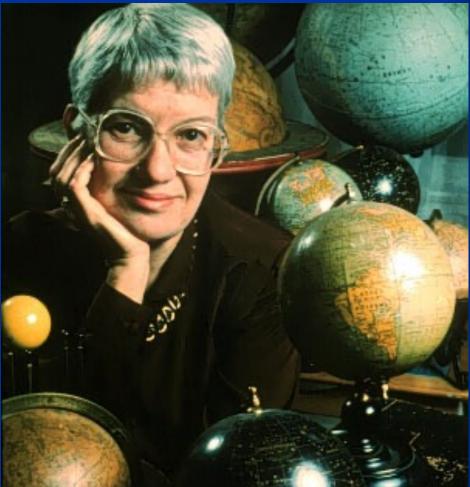

It's not stars, it doesn't shine. It's DARK.

Vera Rubin and Kent Ford in 1970s

Studied rotation curves of galaxies, and found that they are all FLAT.

This work led to scientific consensus that the DM problem is ubiquitous.

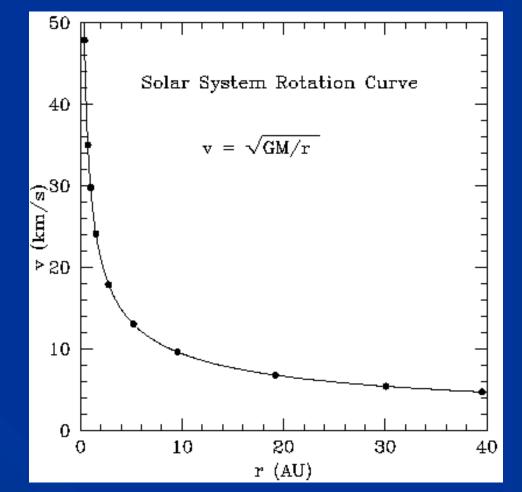

Analogy: Solar System Rotation Curve

Average Speeds of the Planets

As you move out from the Sun, speeds of the planets drop.

If Sun were more massive, planets would move faster

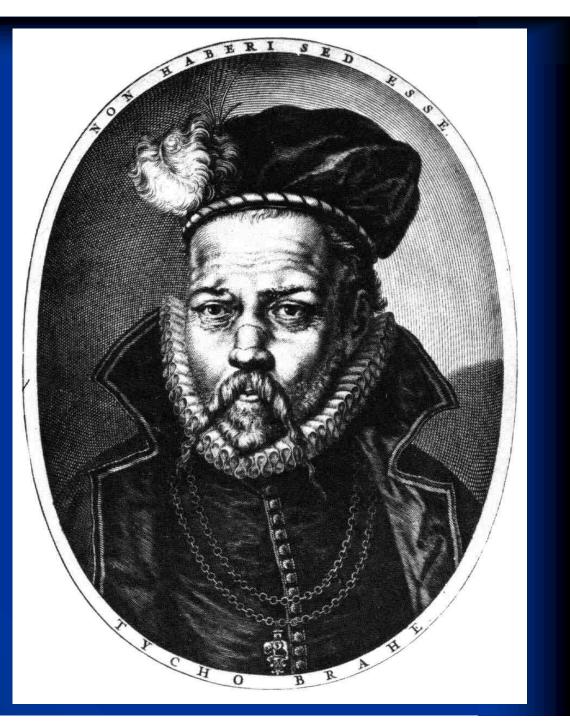

SHOWS THE IDEA (This slide has nothing to do with proving DARK MATTER exists)

Tyco Brahe (1546-1601)

Lost his nose in a duel, and wore a gold and silver replacement.

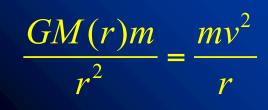

Studied planetary orbits.

Died of a burst bladder at a dinner with the king.

Now let's get back to Dark Matter: Rotation Curves of Galaxies

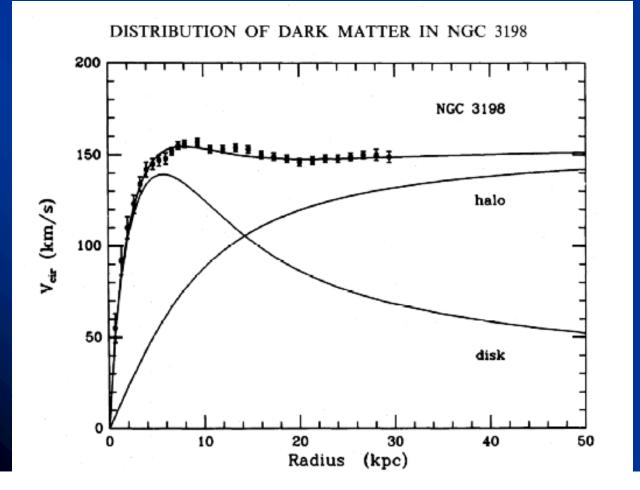

Orbit of a star in a Galaxy: speed is Determined by Mass. Larger mass causes faster orbits.

95% of the matter in galaxies is unknown dark matter

Rotation Curves of Galaxies:

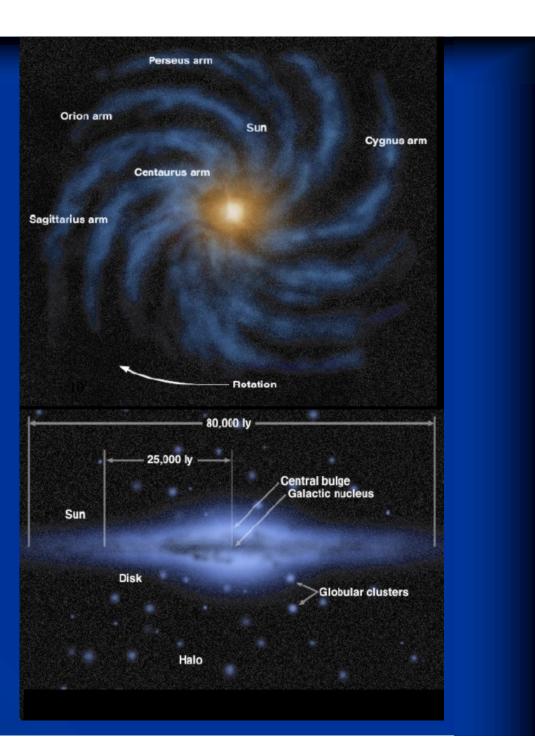

OBSERVED: FLAT ROTATION CURVE

EXPECTED FROM STARS

Our Galaxy: The Milky Way

The mass of the galaxy:

2020 Nobel Prize in Physics

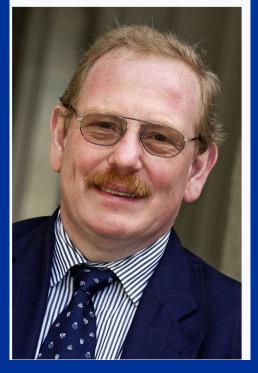

(half) for the discovery of the supermassive black hole at the center of our Milky Way Galaxy

Andrea M. Ghez

The BH weighs 4 million Suns

Reinhard Genzel

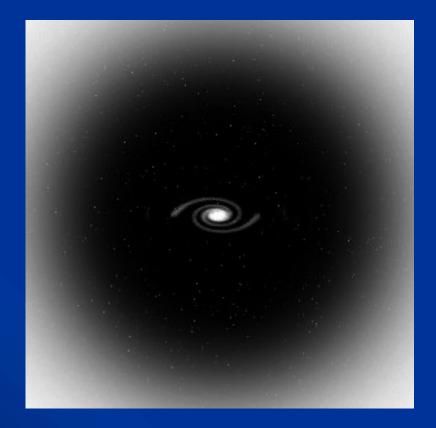

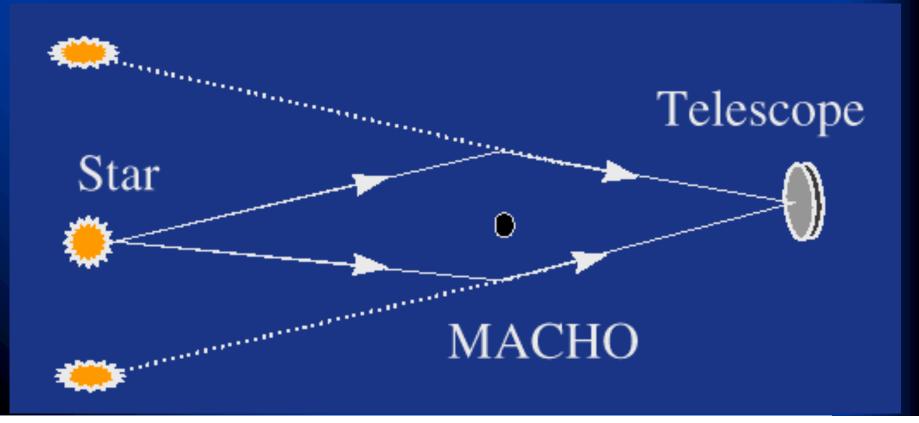

SUPERMASSIVE BLACK HOLES are NOT the DARK MATTER

Every galaxy has one at the center, but they make up only a tiny fraction of the Universe as a whole

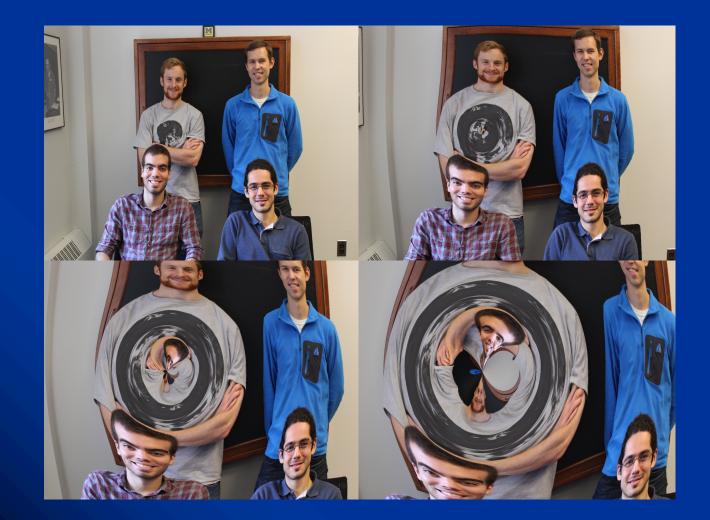

Galaxies have Dark Matter Haloes

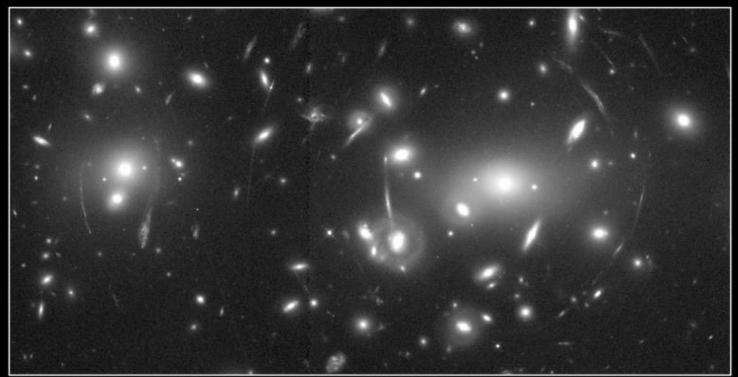

Einstein's Lensing: Another way to detect dark matter: it makes light bend

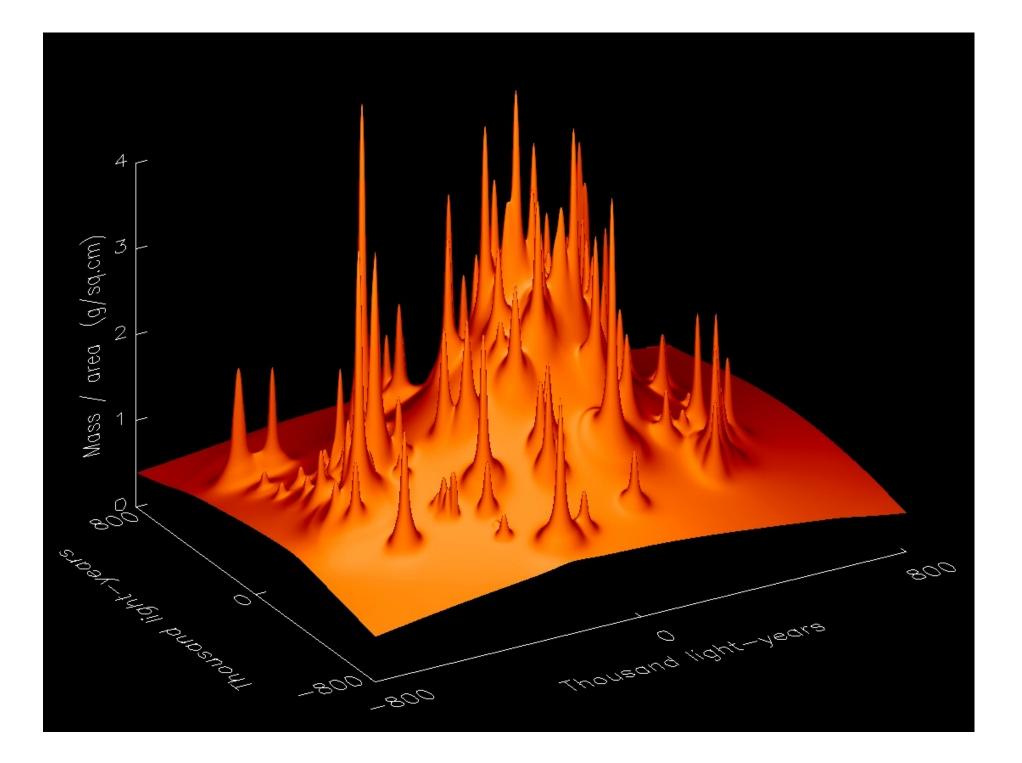

Lensing of students

Strong lensing by dark matter

The Bullet Cluster:

Two merging clusters: dark matter passes through while atoms get stuck

Atomic Matter 🔰

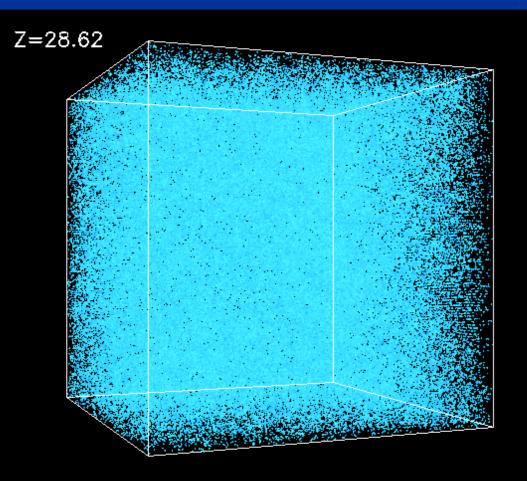

Dark Matter 🔰

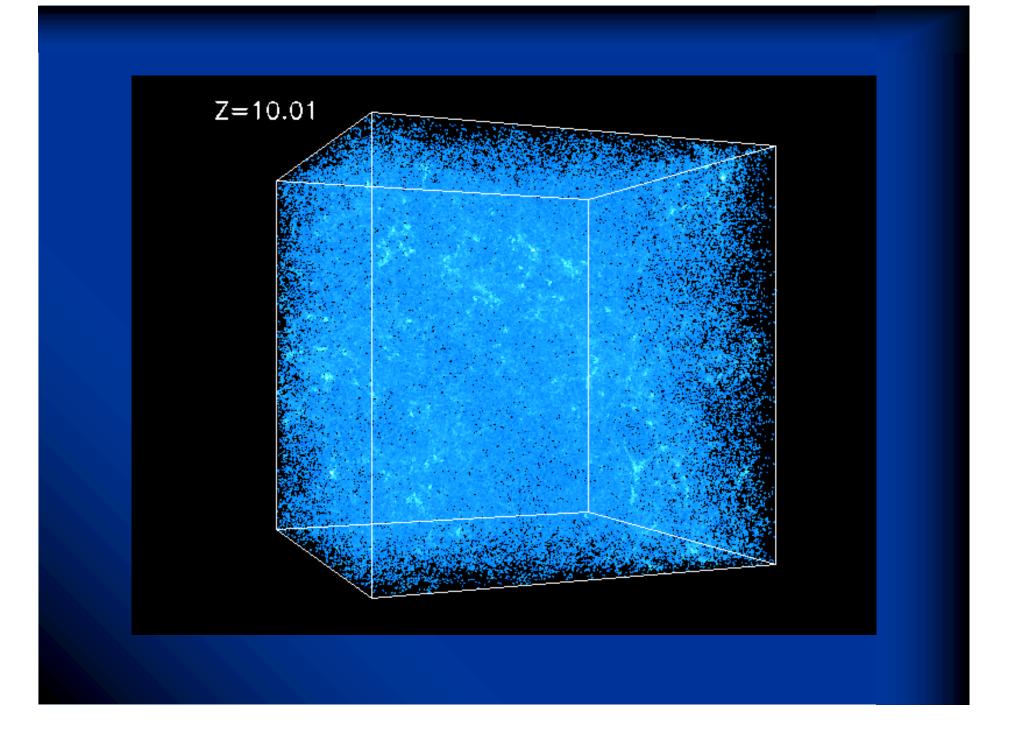

Evidence for Dark Matter: Formation of Structure, Computer Simulations

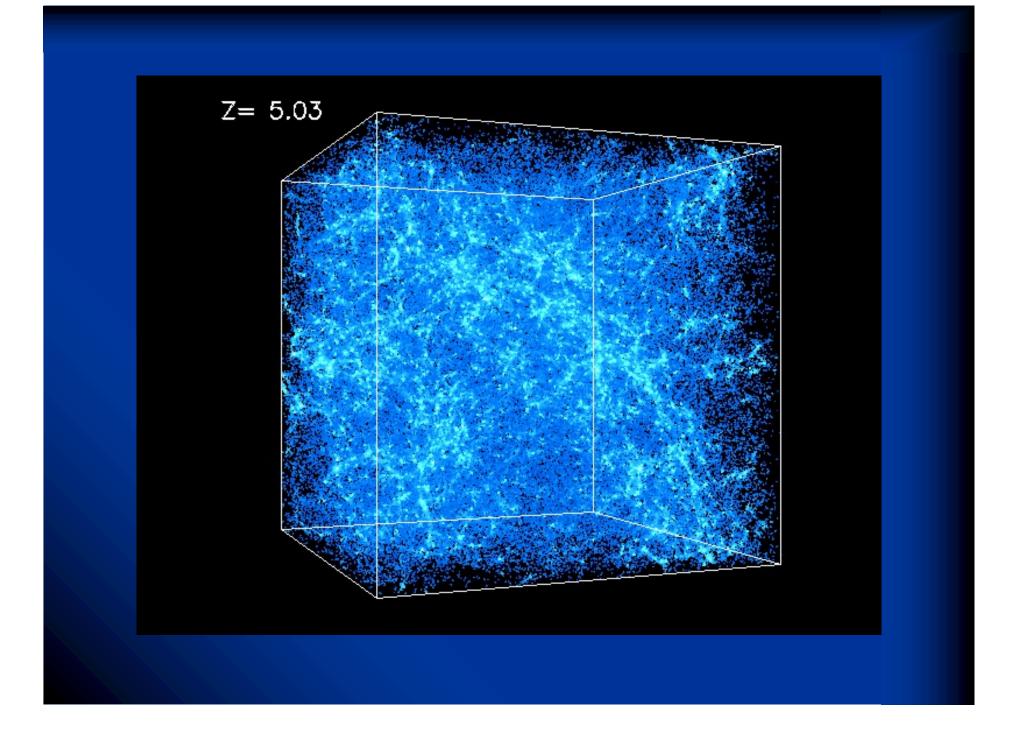

Initial conditions from inflation

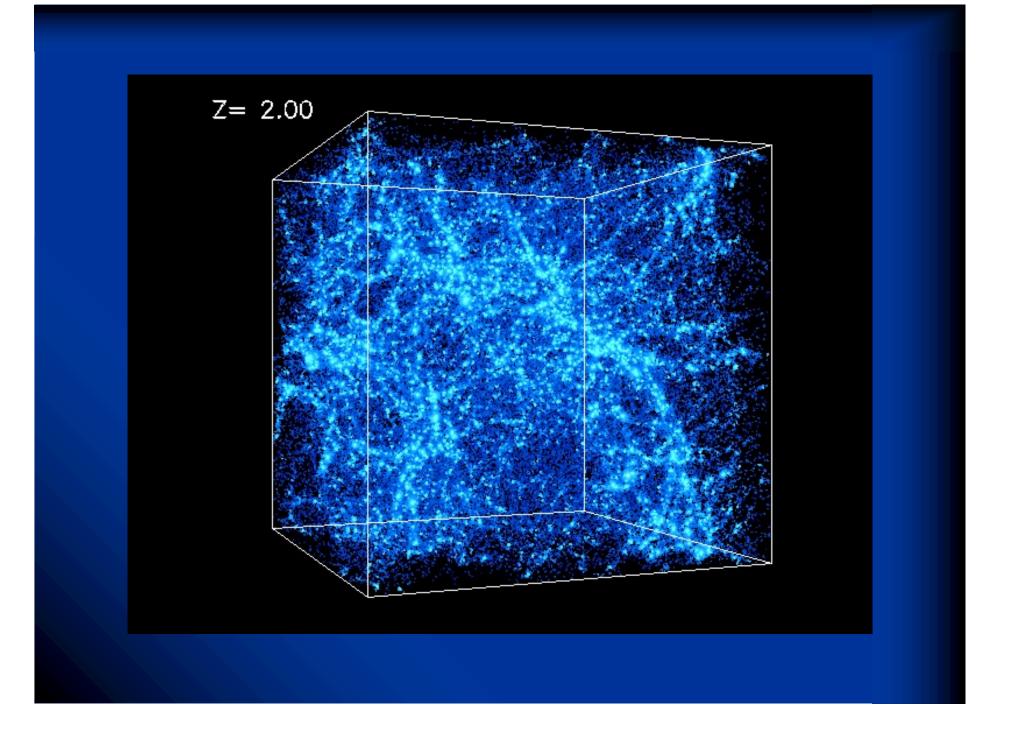

Dark Matter particles come together to make galaxies, clusters, and larger scale structures

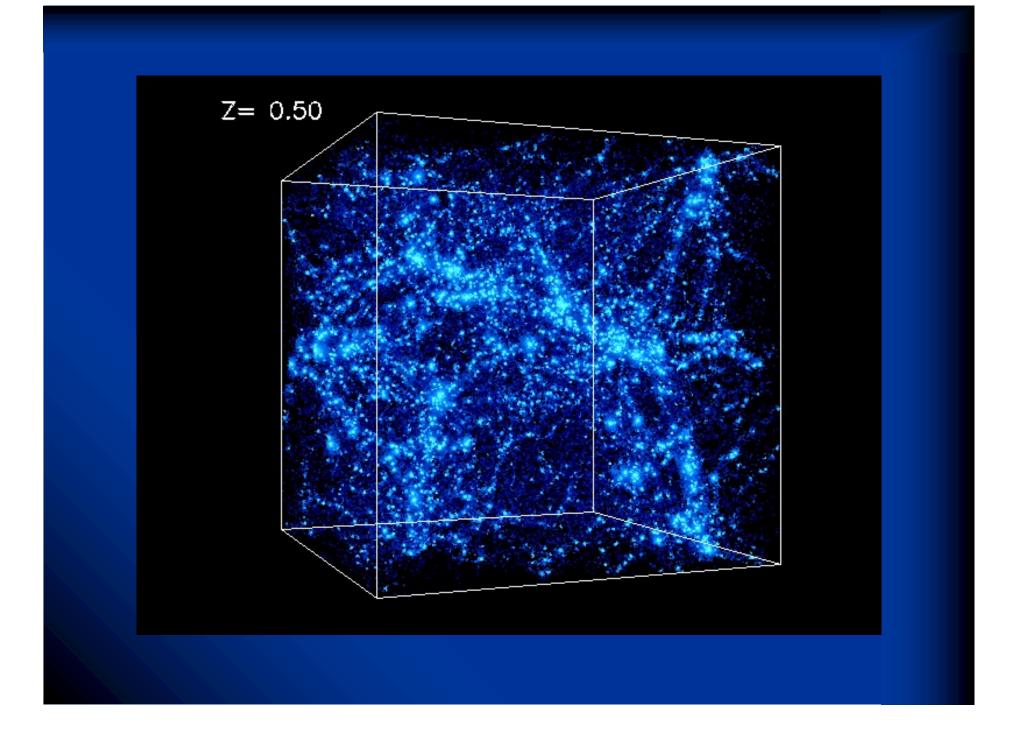

Computer simulations with dark matter match the data

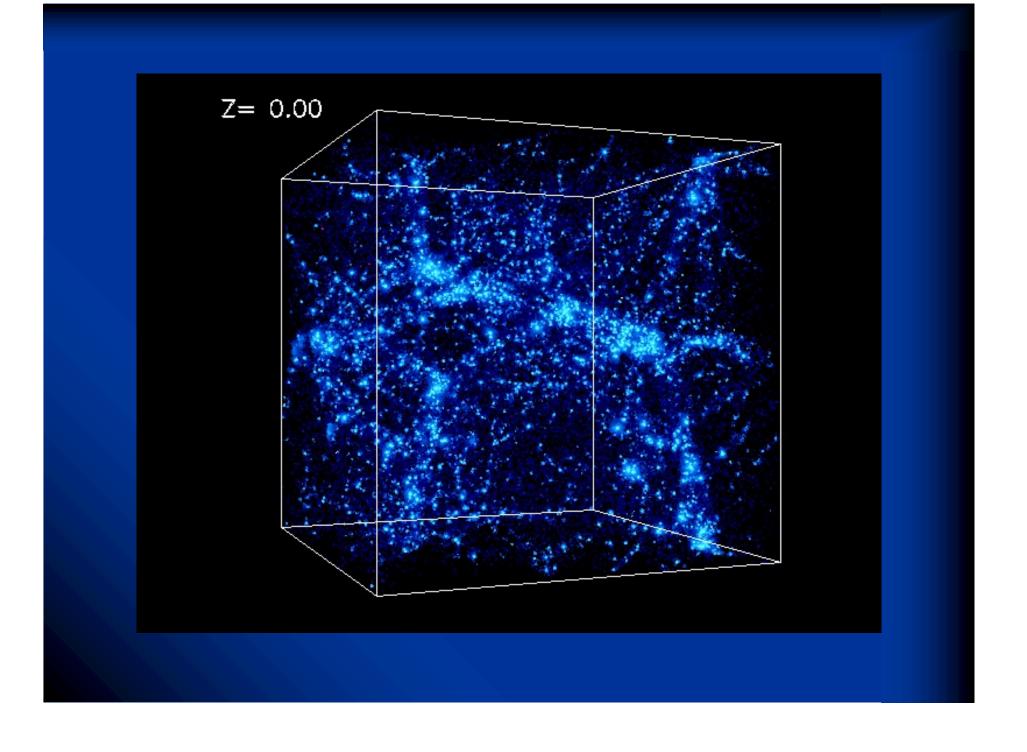

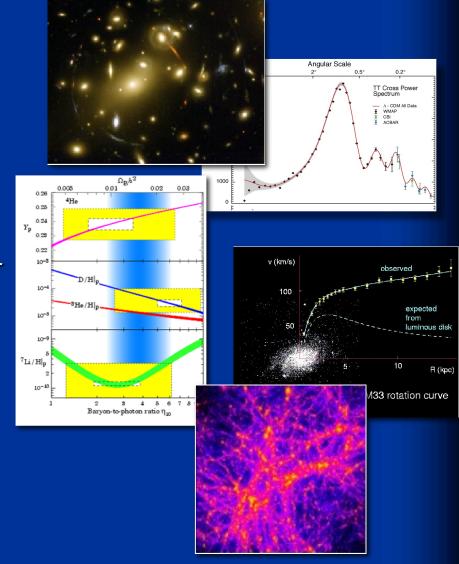

Evidence for Dark Matter Redux

 There exists a wide variety of independent indications that dark matter exists

 Each of these observations infer dark matter's presence through its gravitational influence

 Still no observations of dark matter's non-gravitational interactions. We still don't know what it is

PIE CHART OF THE UNIVERSE

WHAT ARE THE PIECES OF THE PIE???

WHAT IS THE DARK MATTER?

The Dark Matter is NOT

- Diffuse Hot Gas (would produce x-rays)
- Cool Neutral Hydrogen (see in quasar absorption lines)
- Small lumps or snowballs of hydrogen (would evaporate)
- Rocks or Dust (high metallicity) (Hegyi and Olive 1986)
- Small stars, planetary objects, white dwarfs or neutron stars (Fields, Freese, and Graff 1990s)

2) What is the Dark Matter? Candidates:

- Cold Dark Matter candidates w/ strong theoretical motivation:
- WIMPs (SUSY or extra dimensions)
- Axions (exist automatically in solution to strong CP problem)
- Neutrinos (too light, ruin galaxy formation)
- Sterile Neutrinos: no Standard Model interaction
- Primordial black holes
- Asymmetric Dark Matter
- Light Dark Matter, Fuzzy DM
- Self Interacting Dark Matter
- Q-balls
- WIMPzillas

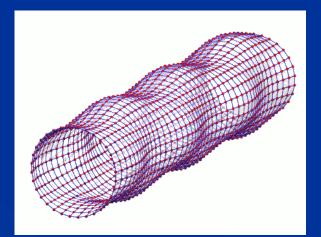

Florian Kuhnel Primordial Black Holes

Primordial Black Holes as Dark Matter?

- Primordial: they would have been born in the Universe's first fractions of a second, when fluctuations in the density led to small regions having enough mass to collapse in on themselves.
- One possibility: they formed at the transition in the early Universe when free quarks became bound together into protons, neutrons, etc. Pressure drop led to black holes.
- Resurgence of interest as possible explanation of gravitational waves seen in LIGO detector in 2016 due to merging black holes as massive as 30 suns.
 There could be millions of these between us and the center of the Milky Way.

Gravitational Waves

 Gravitational waves alternately stretch and squeeze space-time both vertically and horizontally as they propagate.

Detection of Gravitational Waves by LIGO

Two arms, 4km each, length of one increases while the other decreases – by a fraction of the size of a proton -- when gravitational waves come by that stretch the spacetime differently in perpendicular directions

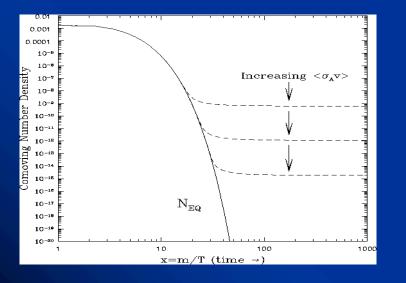

2017 Nobel Prize to Barish, Thorne, and Weiss

Best motivated Dark matter candidates: cosmologists don't need to "invent" new particles

Weakly Interacting
 Massive Particles
 (WIMPS). e.g.,neutralinos

Axions

m_a~10⁻⁽³⁻⁶⁾ eV arise in Peccei-Quinn solution to strong-CP problem (Weinberg; Wilczek; Dine, Fischler, Srednicki; Zhitnitskii)

Axions

Axions automatically exist in a proposed solution to the strong CP problem in the theory of strong interaction. They are very light, weighing a trillionth as much as protons; yet they are slow-moving. Axions are among the top candidates for dark matter.

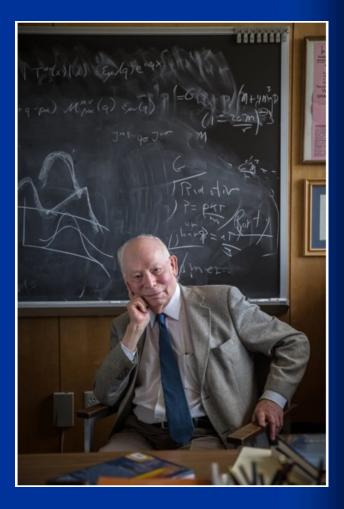

Frank Wilczek

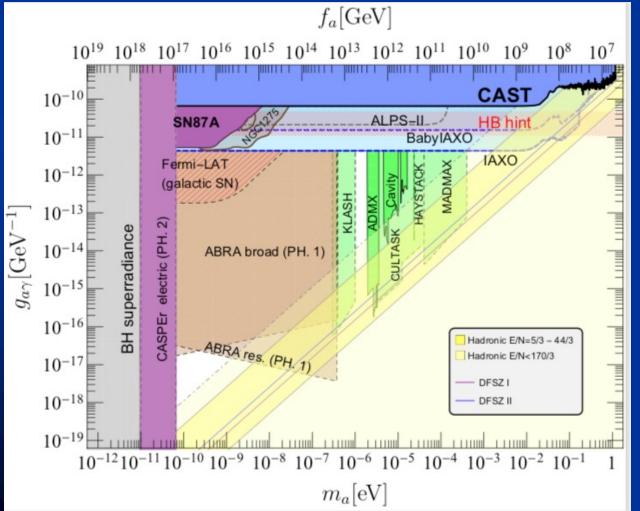

Steven Weinberg

Steven Weinberg, 1933- July 23, 2021

- Driver of some of the most groundbreaking ideas of the last half century. One of the most important thinkers on the planet and a wonderful human being.
- Foundational work creating the Standard Model of Particle Physics.
- We will miss him terribly at University of Texas --
- A major loss for us and for the world!

Very active area: Searches for Axions and Axion Like Particles

From review by Luca Visinelli

Among the top candidates for Dark Matter Particles: WIMPs

- Weakly Interacting Massive Particles
- Billions pass through your body every second (one a day—month hits)
- No strong nuclear forces
- No electromagnetic forces
- Yes, they feel gravity
- Of the four fundamental forces, the other possibility is weak interactions (e.g. responsible for radioactivity)
- Weigh 1 to 10,000 times protons

Two reasons we favor WIMPs: First, the numbers come out right!

Weakly Interacting Massive Particles Many are their own antipartners. Annihilation rate in the early universe determines the density today.

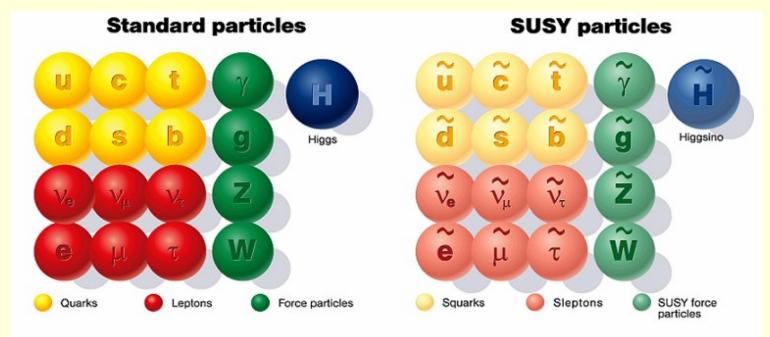

$$\Omega_{\chi}h^2 = \frac{3 \times 10^{-27} \ cm^3/\text{sec}}{\langle \sigma v \rangle_{ann}}$$

This is the mass fraction of WIMPs today, and gives the right answer if the dark matter is weakly interacting

> WIMP mass: Their possible weights vary between

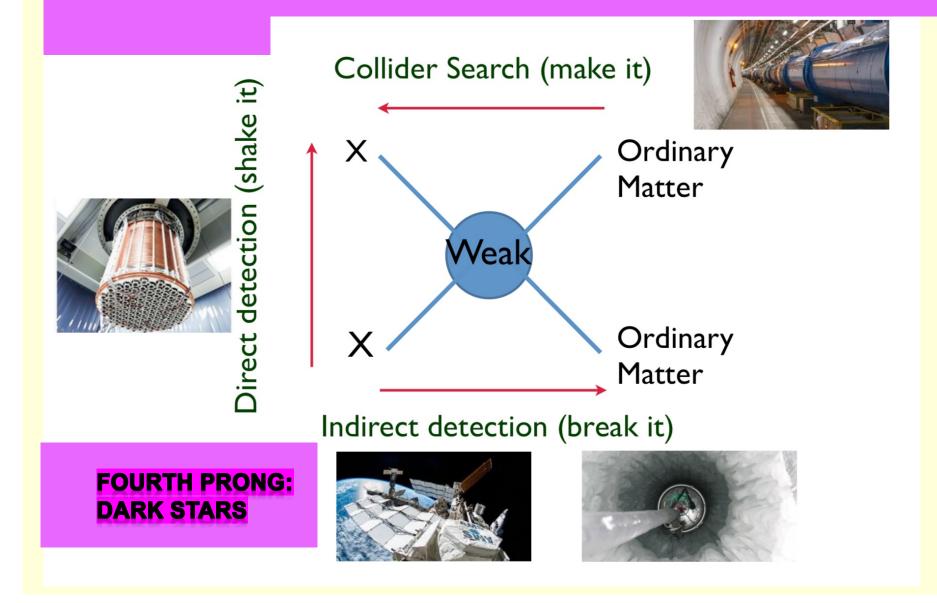

Another reason we favor WIMPS: in particle theories, eg supersymmetry

Every particle we know has a partner

 The lightest supersymmetric particle may be the dark matter.

THREE PRONGED APPROACH TO WIMP DETECTION

FIRST WAY TO SEARCH FOR WIMPS

Large Hadron Collider at CERN

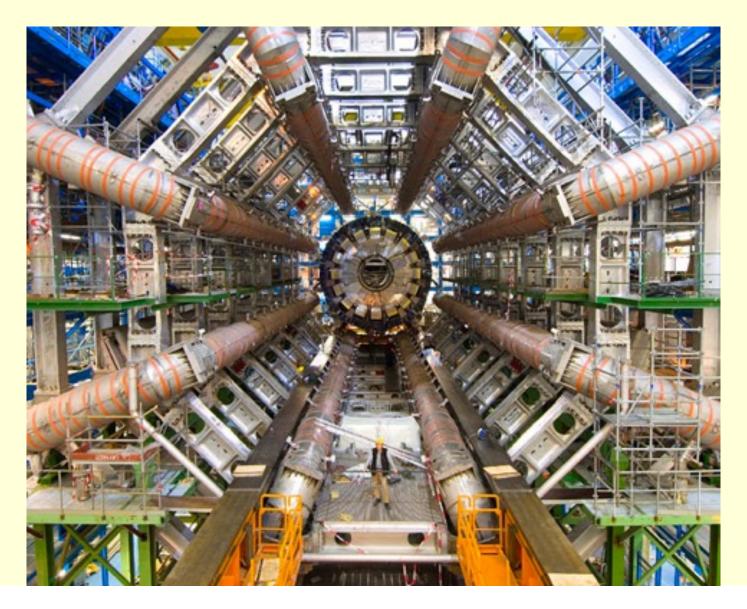

Ring that is 17 miles around.

Two proton beams traveling underground in opposite directions collide at the locations of the detectors

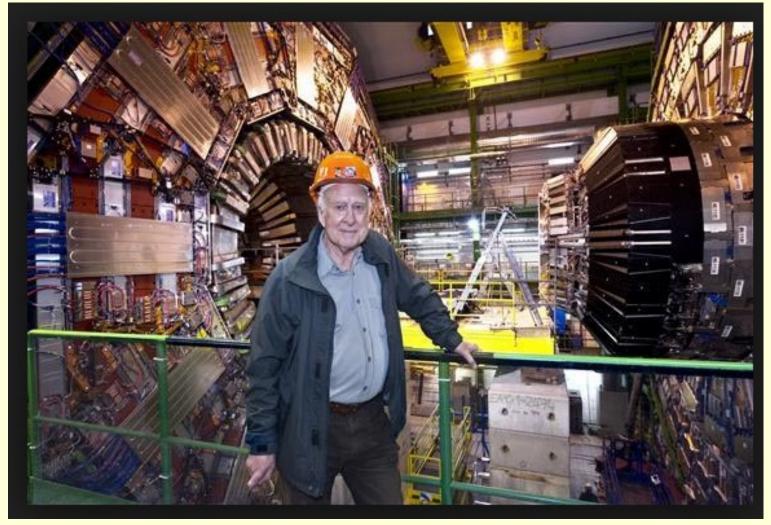

ATLAS detector: Fabiola Gianotti, spokesperson for Higgs searches now Director General at CERN

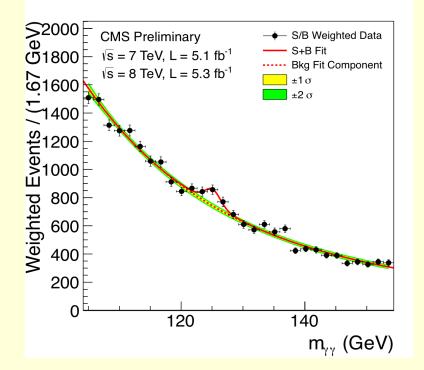

ATLAS Detector at CERN

Peter Higgs and CMS detector

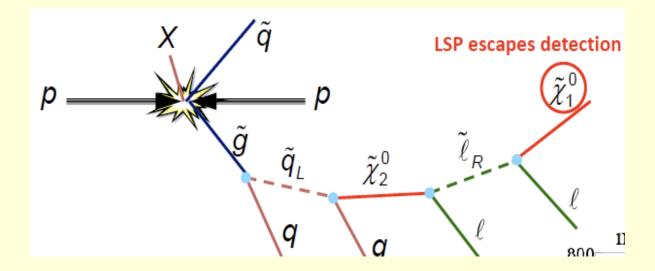

LHC's first success Discovery of Higgs boson weighing 125 GeV

Key role of Higgs: imparts mass to other particles

Second major goal of LHC: search for SUSY and dark matter

• Two signatures: Missing energy plus jets

 Nothing seen yet: particle masses pushed to higher masses

SECOND WAY TO SEARCH FOR WIMPS

DIRECT DETECTION Laboratory EXPERIMENTS

DIRECT DETECTION OF WIMP DARK MATTER

A WIMP in the Galaxy travels through our detectors. It hits a nucleus, and deposits a tiny amount of energy. The nucleus recoils, and we detect this energy deposit.

Expected Rate: less than one count/kg/day!

How did I get into Cosmology and studies of Dark Matter?

PhD Advisor at Univ of Chicago, David Schramm

Drukier, Freese, & Spergel (1986) We studied the WIMPs in the Galaxy and the particle physics of the interactions to compute expected count rates, and we proposed annual modulation to identify a WIMP signal

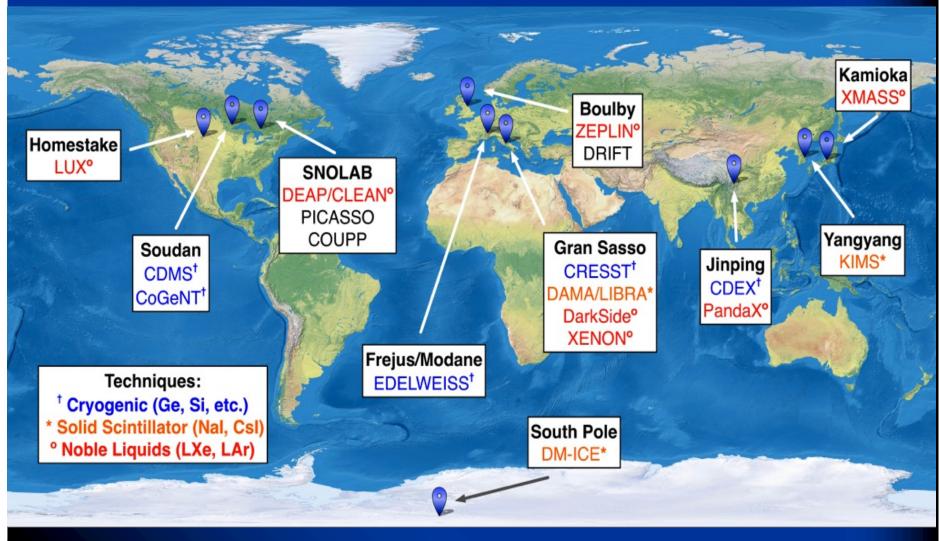

WIMP detectors must be in underground laboratories

Need to shield from Cosmic Rays

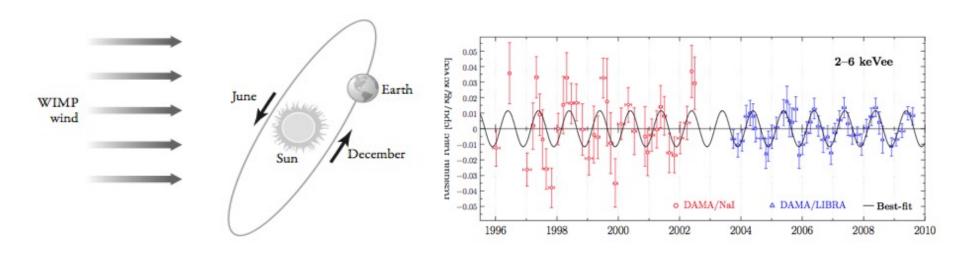

XENON experiment in Gran Sasso Tunnel (talk of Manfred Lindner)

UNDERGROUND DARK MATTER LABORATORIES WORLDWIDE

DAMA annual modulation

Drukier, Freese, and Spergel (1986); Freese, Frieman, and Gould (1988)

Nal crystals in Gran Sasso Tunnel under the Apennine Mountains near Rome.

Data do show modulation at 14 sigma. Peak in June, minimum in December (as predicted). Are these WIMPs??

Two Issues with DAMA

1. The experimenters won't release their data to the public

2. Comparison to other experiments:
 Other experiments don't confirm their results (see no signal)
 But comparison is difficult because experiments are made of different detector materials

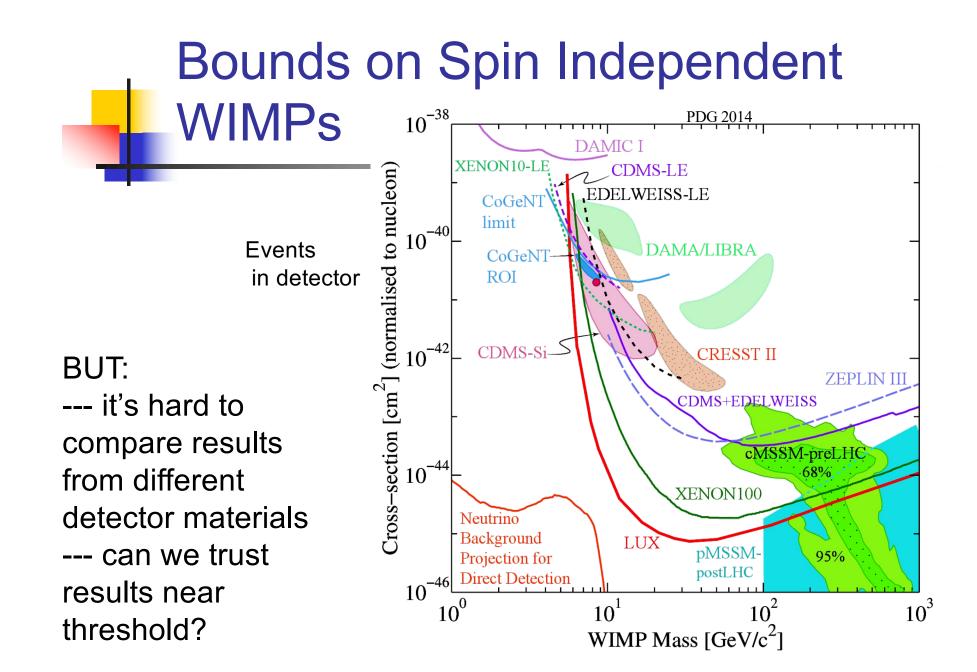

"I'm a Spaniard caught between two Italian women"

Rita Bernabei, DAMA

Juan Collar, COGENT

Elena Aprile, XENON

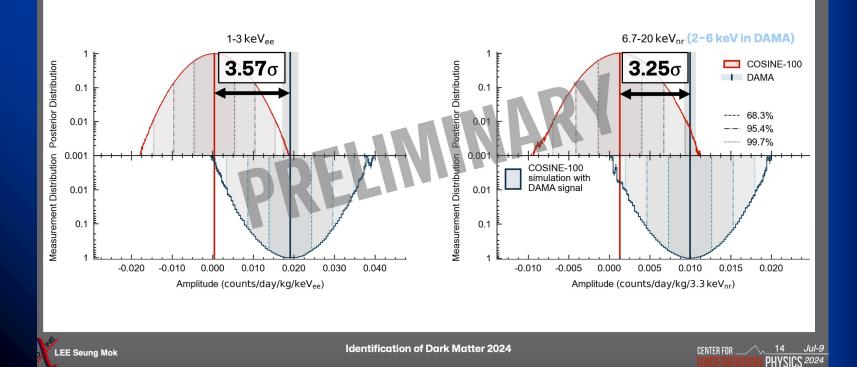

To test DAMA

- Unexplained signal still there after 13 years
- Other groups are now using the same material: Nal crystals
- COSINE-100 has new results out today!
- NO MODULATION: disagrees with DAMA in terms of dark matter interpretation
- SABRE (Princeton) with Australia
- ANAIS also has new results today, no modulation
- COSINUS

TALK TODAY at International Dark Matter meeting in l'Aquila: Cosine-100 disagrees with DAMA at 99% statistical confidence

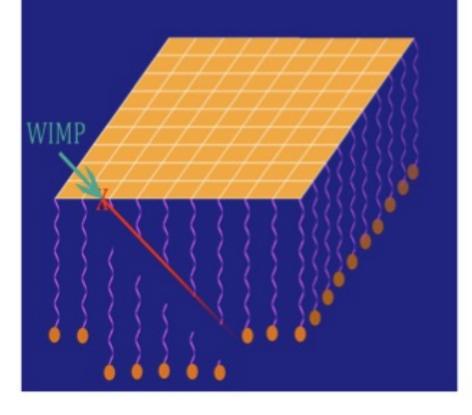

No Modulation Detected

New idea: DNA for dark matter detector

1 kg Gold, 1 kg ssDNA, identical sequences of bases with an order that is well known

ssDNA Based Detector

WIMP from galaxy knocks out Gold nucleus, which traverses DNA strings, severing the strand whenever it hits.

Drukier, KF, Lopez, Spergel, Cantor, Church, Sano

Paleodetectors

WIMPs leave tracks in ancient minerals from 10km below the surface of the Earth.

Collecting tracks for 500 Myr.

Backgrounds: Ur-238 decay and fission Take advantage of nanotools: can identify nanometer tracks in 3D

Baum, Drukier, Freese, Gorski, Stengel arXiv:1806.05991

Despite making up most of the universe, we still haven't detected dark matter. A clue could lie buried in ancient rocks, says physicist **Sebastian Baum** OST of our universe is missing. Observations of the smallest galaxies to show that ordinary matter - the stuff that makes up you, me and everything we see in the cosmos around us - accounts for only one-fifth of all matter. The remaining 80 per cent is a mystery. After decades trvine to hunt down this

UCLA DARK MATTER MEETING

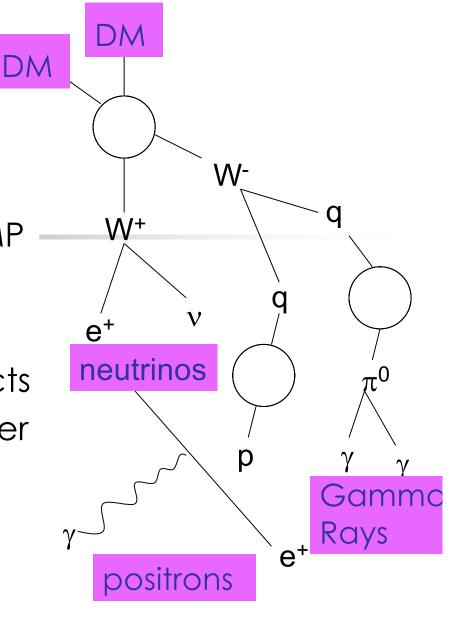

INDIRECT DETECTION: searching for astrophysical WIMP annihilation products

WIMP Annihilation

Many WIMPs are their own antiparticles, annihilate among themselves:

 1) Early Universe gives WIMP miracle

•2) Indirect Detection expts
look for annihilation products
•3) Same process can power
Stars (dark stars)

Indirect Detection: looking for DM annihilation signals

AMS aboard the International

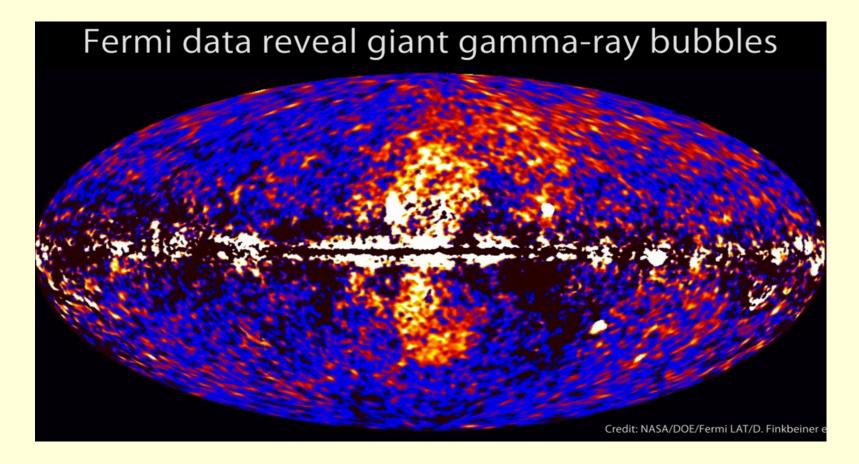

INDIRECT DETECTION: HIGH ENERGY PHOTONS (GAMMA-RAYS)

Are they from DM annihilation?

THE FERMI SATELLITE

The gamma ray sky

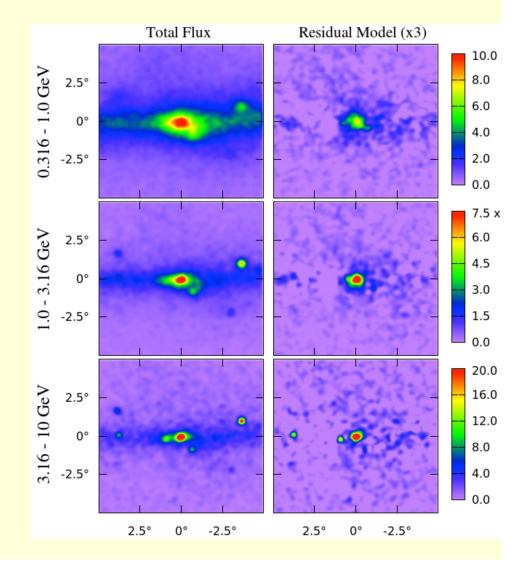

Excess from Galactic Center could be from Dark Matter annihilation

Unexplained light coming from the Galactic Center: could it be a discovery of Dark Matter?

Towards galactic center:

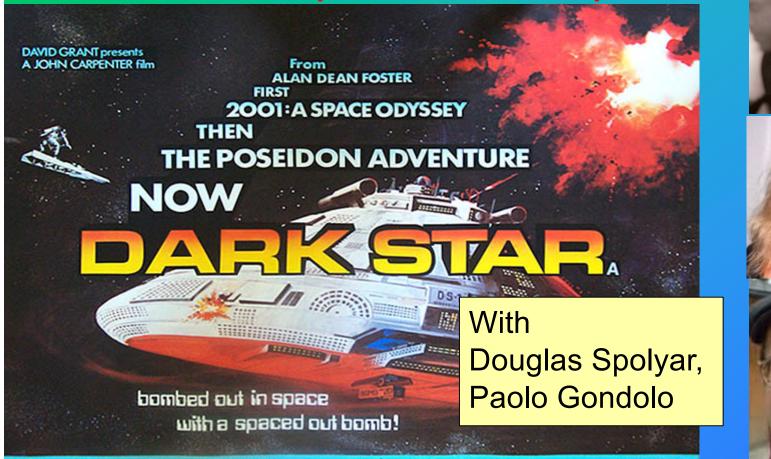

- Model and subtract astrophysical sources
- Excess remains
- Consistent with DM (50 GeV)
- BUT it could be astrophysical point sources. Status unclear.
- (Hooper and Goodenough)
- Interesting Hint of Detection!

FOURTH WAY TO SEARCH FOR WIMPS

Dark Stars: Dark Matter annihilation can power the first stars

Fourth Way: Find Dark Stars (hydrogen stars powered by dark matter) in James Webb Space Telescope, sequel to Hubble

AINTARCH HADDIS DANI CRANNYNI BRIAN NADELLE VEN CADDENTS

Dark Stars

The first stars to form in the history of the universe may be powered by Dark Matter annihilation rather than by Fusion. Dark stars are made almost entirely of hyrdogen and helium, with dark matter constituting less than 0.1% of the mass of the star).

- This new phase of stellar evolution may last millions to billions of years
- Dark Stars can grow to be very large: up to ten million times the mass of the Sun. Supermassive DS are very bright, up to a billion times as bright as the Sun. These may have been seen in James Webb Space Telescope.
- Once the Dark Matter runs out, the DS has a fusion phase before collapsing to a big black hole: IS THIS THE ORIGIN OF SUPERMASSIVE BLACK HOLES?

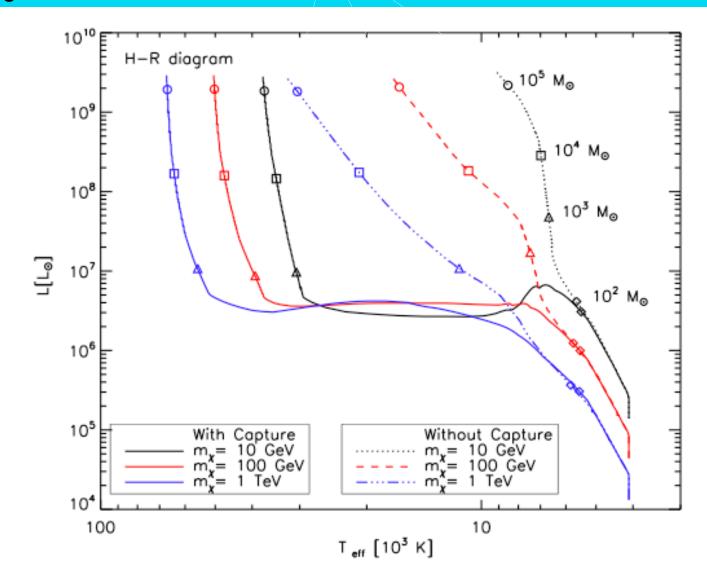

Basic Picture

- The first stars form 200 million years after the Big Bang in the centers of protogalaxies --- right in the DM rich center.
- As a gas cloud cools and collapses en route to star formation, the cloud pulls in more DM gravitationally.
- DM annihilation products typically include e+/e- and photons. These collide with hydrogen, are trapped inside the cloud, and heat it up.
- At a high enough DM density, the DM heating overwhelms any cooling mechanisms; the cloud can no longer continue to cool and collapse. A Dark Star is born, powered by DM.

DS Properties

- We find that DS are big puffy objects:
 - Massive: can grow to ten million times the mass of the Sun --- $10^7\,M_{\odot}$
 - Enormous Radii: 10 a.u. (radius of Earth's orbit around Sun)
 - Very Bright: up to ten billion times as bright as the Sun --- $10^{10} L_{\odot}$
 - Cool: 10,000 K vs. 100,000 K plus
 - Long lived: more than 10⁶ years, even till today?.
 - Not blowing off hot material that prevents further accretion

Building up the Mass: a Dark Star starts with the mass of the Sun, Some keep growing up to a million times the mass of the Sun and a billion times as bright!

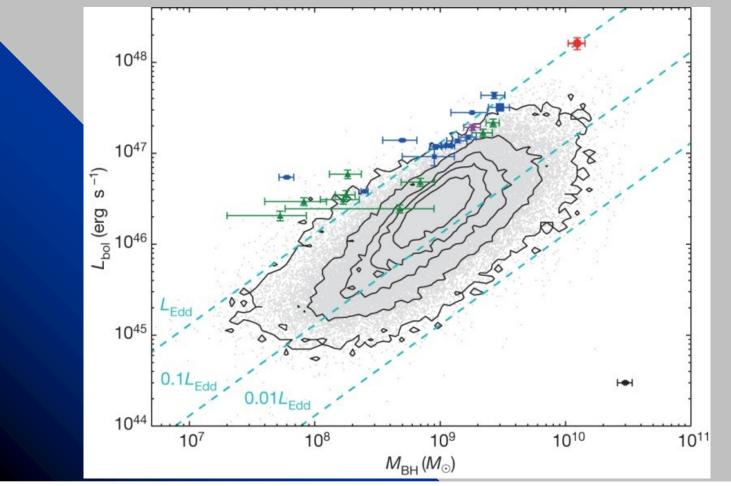

Helps Solve the BIG BLACK HOLE PROBLEM!

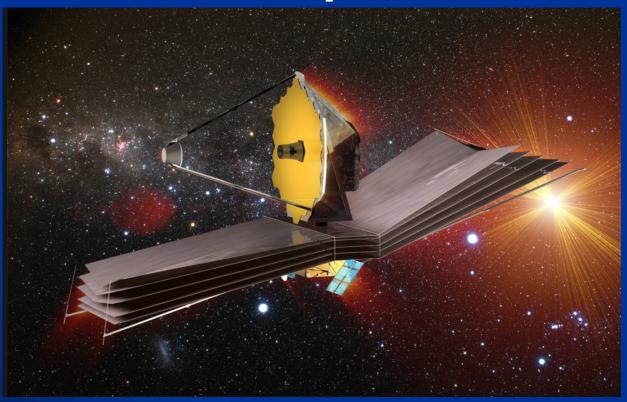

After the Dark Stars die, they collapse to million solar mass black holes which can merge together to make the otherwise unexplained very early giant black holes.

nature

Challenging to form 10¹⁰ M^O Supermassive Black Holes

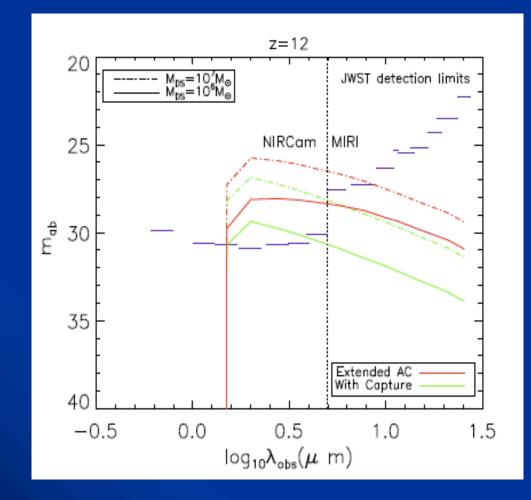

Observing Dark Stars with James Webb Space Telescope

One supermassive dark star would be as bright as an entire early galaxy of stars. Observable in JWST!

Dark Stars in JWST

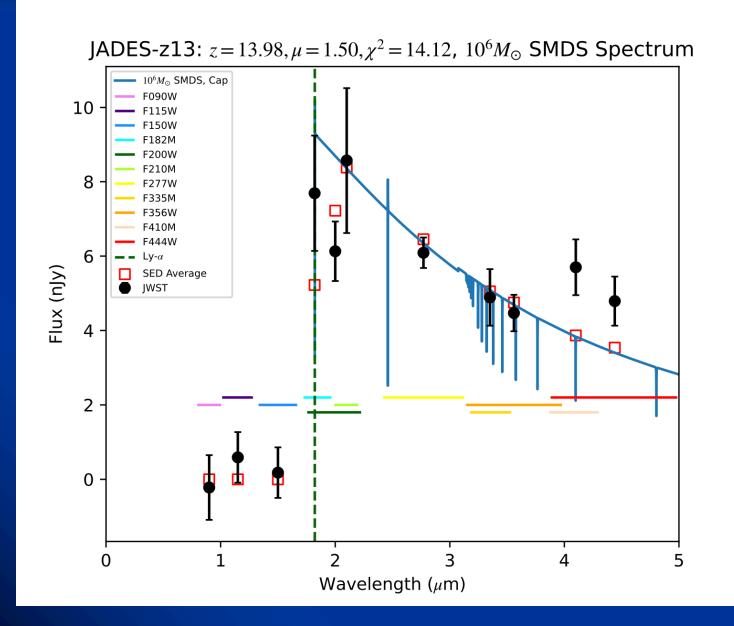

Of 5 objects in JWST data with spectra: 3 could be Dark Stars!

JWST ADVANCED DEEP EXTRAGALACTIC SURVEY (JADES) WEBB SPECTRA REACH NEW MILESTONE IN REDSHIFT FRONTIER

NIRCam Imaging NIRSpec Microshutter Array Spectroscopy **Highest redshift** Lyman break z = 13.20Jades z13 z = 12.63Jades z12 Wavalangth of Ligh z = 11.58 Jades z11 Wavelength of Light z = 10.38Lowest redshift

Criteria to be Supermassive Dark Star candidates vs. early galaxies:

- 1) Point object (SMDS) vs. extended object (galaxy)
- 2) DS spectra match data (the right amount of light in different wavelength bands)
- 3) Dark stars are only made of hydrogen and helium from the Big Bang; galaxies have many other elements like carbon, nitrogen, etc.
- 4) Smoking gun for Dark Stars: HeII1640 absorption line

The Bottom Line

- JWST found ~ 700 bright objects from the early Universe. They assumed these are "galaxy candidates"
- Too many galaxies for the standard model of cosmology.
- Are some of them Dark Stars?

One Dark Star can be as bright as an entire galaxy of early stars

OUR RESULTS: Three of the five hi-z JWST objects with Dark Stars.

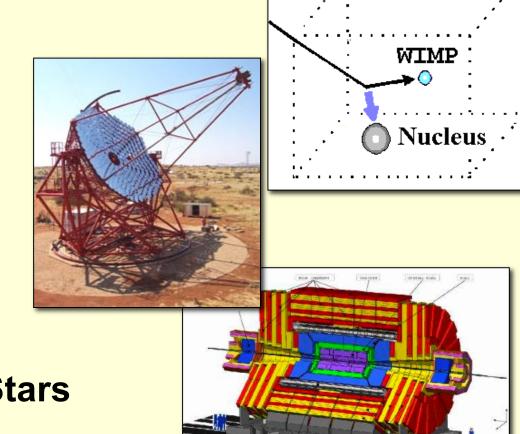

WIMP Hunting: Good chance of detection this decade

Direct Detection

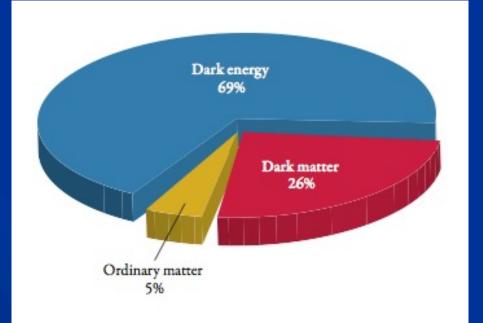

Indirect Detection

Even stranger: Dark Energy

DARK ENERGY: Galaxies are accelerating apart from one another!

The panel on "The Dark Side of the Universe" at the World Science Festival in NY in June 2011

The three women representing Dark Matter are, from the right, Katherine Freese, Elena Aprile, and Glennys Farrar. Continuing to the left are three men representing Dark Energy: Michael Turner, Saul Perlmutter and Brian Greene (co-host of the Festival).

"Dark matter is attractive, while dark energy is repulsive!"

The Cosmic Cocktail Recipe

3 oz. dark matter
7 oz. dark energy
1/2 oz. hydrogen and helium gas
3 thousandths oz. other chemical elements
5 hundredths oz. stars
5 hundredths oz. neutrinos
5 ten-thousandths oz. cosmic microwave background light
1 millionth oz. supermassive black holes

Shaken, not stirred. Secret ingredient: dark matter

THE END and extra slides

At Nobel Prize dinner and ball 2017

Fuzzy Dark Matter (UltraLight Axion)

- Particle masses are around 10⁻³² times that of a proton. So light they act more like waves than particles.
- At scales larger than galaxies the dark matter acts like cold dark matter, while below the scale quantum pressure from the uncertainty principle suppresses the smaller structure formation so that it can resolve the small scale crisis of the conventional cold dark matter model.

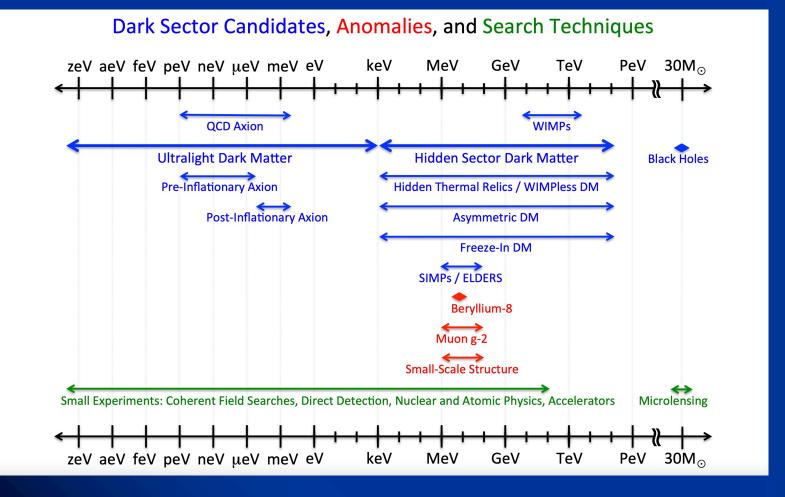

Fuzzy Dark Matter (ultralight axion)

Particle masses are around 10⁻³² times that of a proton. So light they act more like waves than particles.

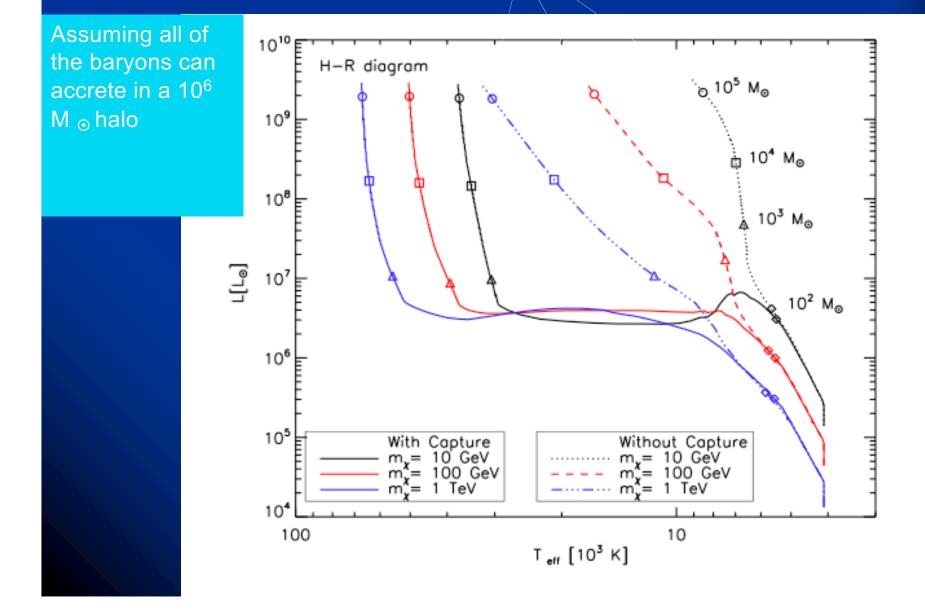

Fuzzy DM. Another possibility is DM as an ultralight scalar field. For particles of mass m and velocity v, the corresponding de Broglie wavelength is

$$\lambda_{\rm dB} \approx 600 \ {\rm pc} \left(\frac{10^{-23} \ {\rm eV}}{m} \right) \left(\frac{10^{-3}}{v} \right).$$
 (2)

The wave nature of the DM stabilizes it from collapse on scales of λ_{dB} , smoothing out inhomogeneities on smaller scales and thereby suppressing structure [230]. For DM within the Galaxy, the scalar field behaves classically. Its pressure oscillates with an angular frequency $\omega \approx 2m$ and induces oscillations in the gravitational potential [231]. DM masses of $m \sim 10^{-23}$ eV are particularly interesting, since the oscillation frequency $f \sim 5 \times 10^{-8} (m/10^{-22} \text{ eV})$ Hz is in the sensitivity range of PTAs. Current limits constrains the ultralight DM density to be below 6 GeV/cm³ for masses $m \leq 10^{-23}$ eV [232].

Super Massive DS due to extended adiabatic contraction since reservoir has been replenished due to orbital structure

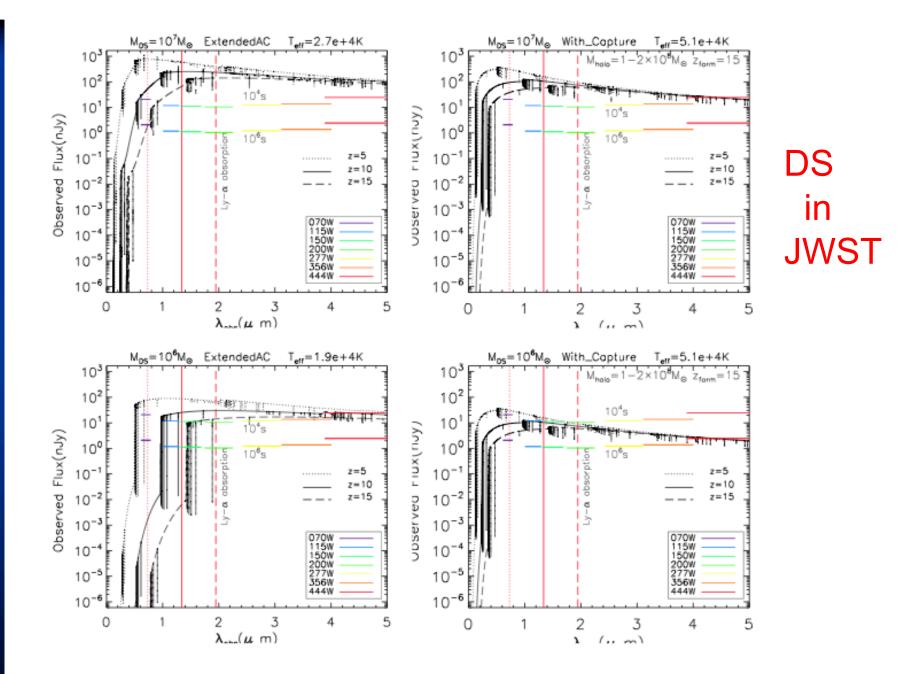

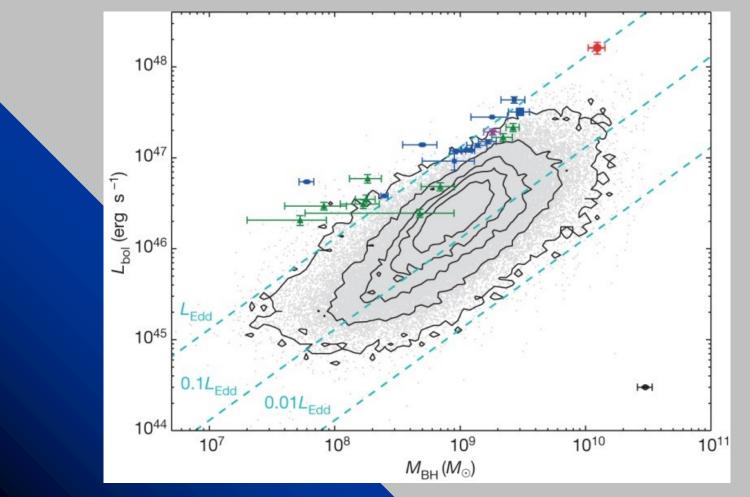

Figure 7. Spectra for supermassive DSs formed at $z_{\text{form}} = 15$ (formation redshift)

What happens next? BIG BLACK HOLES

- Star reaches T=10⁷K, fusion sets in.
- A. Heger finds that fusion powered stars heavier than 153,000 solar masses are unstable and collapse to BH
- Less massive Pop III star lives a million years, then becomes a Black Hole
- Helps explain observed black holes:
- (I) in centers of galaxies
- (ii) billion solar mass BH at z=6 (Fan, Jiang)
- (iii) intermediate mass BH

SupperMassive Black holes from Dark Stars

Very Massive progenitor Million Solar Masses at z=6 No other way to form supermassive BH this early

ABSTRACT

Quasars are the most luminous non-transient objects known, and as such, they enable unparalleled studies of the universe at the earliest cosmic epochs. However, despite extensive efforts from the astronomical community, the guasar ULAS J1120+0641 at z = 7.09 (hereafter J1120+0641) has remained as the only one known at z > 7 for more than half a decade¹. Here we report observations of the guasar ULAS J134208.10+092838.61 (hereafter J1342+0928) at a redshift of z = 7.54. This guasar has a bolometric luminosity of $4 \times 10^{13} L_{\odot}$ and a black hole mass of $8 \times 10^8 M_{\odot}$. The existence of this supermassive black hole when the universe was only 690 Myr old, i.e., just 5% its current age, reinforces early black hole growth models that allow black holes with initial masses $\geq 10^4 M_{\odot}^{2,3}$ or episodic hyper-Eddington accretion^{4,5}. We see strong evidence of the quasar's Ly α emission line being absorbed by a Gunn-Peterson damping wing from the intergalactic medium, as would be expected if the intergalactic hydrogen surrounding J1342+0928 is significantly neutral. We derive a significant neutral fraction, although the exact value depends on the modeling. However, even in our most conservative analysis we find $\bar{x}_{HI} > 0.33$ ($\bar{x}_{HI} > 0.11$) at 68% (95%) probability, indicating that we are probing well within the reionization epoch.

-201 Dec 5 [astro-ph.GA] arXiv:1712.01860v1
